

Quiz 6

Question 1, 2

Augmenting path in residual network and pushing flow = 1

the result Flow = 6

new res. network

new augmenting path

new flow = 7

new res. network

Since there are no augmenting path in the final res. net. $\Rightarrow$ we reached max-flow

$\Rightarrow$ max-flow = min-cut $\Rightarrow$ both are 7

$7 \{s\} \{a,b,c,d,e,t\}$

Question 3 if price $BC=4, BD=5, CD=3$

the LP = $\max \quad 4(x_{BC} + y_{BC}) + 5(x_{BD} + y_{BD}) + 3(x_{CD} + y_{CD})$

s.t. $x_{BC} + y_{BC} + x_{BD} + y_{BD} \leq 18 \quad (\text{Edge } bB)$

$x_{BC} + x_{BD} + y_{CD} \leq 19 \quad (\text{Edge } bc)$

$\vdots$

(there are 5 more such constraints)

$$u_{BC} + y_{BC} \geq 7$$

$$u_{BD} + y_{BD} \geq 7$$

$$u_{CD} + y_{CD} \geq 7$$

$$u, y \geq 0$$

A feasible solution

$$u_{BD} = 0 \quad y_{BD} = 7$$

$$u_{BC} = 7 \quad y_{BC} = 0$$

$$u_{CD} = 7 \quad y_{CD} = 0$$

Question 5

a) $\{4,8\}, \{2,5\}, \{0,6\}, \{1,7\}, \{3,9\}$

Note : this is a perfect matching

b) Note : This is similar to a bipartite graph since in final flow graph each node (excluding for s, t) have at most one incoming edge and one outgoing.

$\Rightarrow$ max flow in this graph is: matching pairs = 1

rest = 0

max flow = 5

$$\Rightarrow \text{min-cut} = 5 \quad \{s\}$$

C) Note that in a all nodes are matched [Perfect matching]

$\Rightarrow$ we cannot possibly add another edge to the matching

$\Rightarrow$ it is max
