# Outline

- A network as a directed graph, examples
- Dynamical systems on networks, examples
- Global-stability problems for network dynamics
- Kirchhoff Matrix-Tree Theorem
- A general global stability result
- Application I: flight formation control of drones
- Application II: global synchronization of coupled oscillators

## A Network as a Directed Graph

A directed graph  $\mathcal{G} = (V, E, A)$ Vertex set:  $V = \{1, 2, \dots, n\}$ Directed edge: (i, j) from vertex i to jWeights:  $A = (a_{ij}), a_{ij} \neq 0 \iff (j, i)$  exists.

Given a nonnegative matrix, there corresponds a digraph  $\mathcal{G}_A$ , for which A is the weight matrix.

## Dynamical Systems on Networks

Given a digraph G = (V, E), a dynamical system can be defined over G.

**Vertex dynamics:**  $u'_i = f_i(t, u_i), i = 1, \cdots, n.$  $u_i \in \mathbb{R}^{m_i}$  and  $f_i : \mathbb{R} \times \mathbb{R}^{m_i} \to \mathbb{R}^{m_i}.$ 

 $\begin{array}{lll} \textbf{Connections:} & g_{ij} : \mathbb{R} \times \mathbb{R}^{m_i} \times \mathbb{R}^{m_j} \to \mathbb{R}^{m_i} \text{ influence of } j \text{ on } i \\ g_{ij} \equiv 0 & \Longleftrightarrow & (j, i) \text{ does not exist.} \end{array}$ 

**Coupled system over** G:

$$u'_i = f_i(t, u_i) + \sum_{j=1}^n g_{ij}(t, u_i, u_j), \quad i = 1, 2, ..., n.$$

#### Global Stability in Network Dynamics

Given a coupled system over a digraph G:

$$u'_i = f_i(t, u_i) + \sum_{j=1}^n g_{ij}(t, u_i, u_j), \quad i = 1, 2, ..., n.$$
 (1)

**Assume:** Each vertex  $u'_i = f_i(t, u_i)$  is globally stable, as insured by a global Lyapunov function  $V_i$ .

### Global Stability in Network Dynamics

Given a coupled system over a digraph G:

$$u'_i = f_i(t, u_i) + \sum_{j=1}^n g_{ij}(t, u_i, u_j), \quad i = 1, 2, ..., n.$$
 (1)

**Assume:** Each vertex  $u'_i = f_i(t, u_i)$  is globally stable, as insured by a global Lyapunov function  $V_i$ .

**Question:** Under what conditions on the underlying network and coupling is the coupled system globally stable?

Of significance in disease control, stability of eco-systems, power distribution grids etc.

#### Main Result

**Theorem** [Z. Shuai and ML, 2009] Assume (1) There exist  $F_{ii}(t, u_i, u_i)$  such that

•
$$V_i(u) \leq \sum_{j=1}^n a_{ij} F_{ij}(t, u_i, u_j), \quad t > 0, \ u_i \in D_i, \ u_j \in D_j, \ j = 1, \cdots, n.$$
(2)

(2) Along each directed cycle C of G,

$$\sum_{(r,s)\in E(\mathcal{C})}F_{rs}(t,u_r,u_s)\leq 0,\quad t>0,\ u_r\in D_r,\ u_s\in D_s. \tag{3}$$

Then there exist constants  $c_i \ge 0$  such that  $V(u) = \sum_{i=1}^{n} c_i V_i(u)$  satisfies

$$V(u) \leq 0, \quad u \in D_1 \times \cdots \times D_n.$$

#### Kirchhoff Matrix-Tree Theorem

Let (G, A) be a weighted digraph with weight matrix  $A = (a_{ij})$ . The Laplacian matrix of graph G is

$$L = \begin{bmatrix} \sum_{k \neq 1} a_{1k} & -a_{12} & \cdots & -a_{1n} \\ -a_{21} & \sum_{k \neq 2} a_{2k} & \cdots & -a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ -a_{n1} & -a_{n2} & \cdots & \sum_{k \neq n} a_{nk} \end{bmatrix}$$

Let  $c_i$  be the cofactor of the *i*-th diagonal element of *L*.

#### Kirchhoff Matrix-Tree Theorem

Let (G, A) be a weighted digraph with weight matrix  $A = (a_{ij})$ . The Laplacian matrix of graph G is

$$L = \begin{bmatrix} \sum_{k \neq 1} a_{1k} & -a_{12} & \cdots & -a_{1n} \\ -a_{21} & \sum_{k \neq 2} a_{2k} & \cdots & -a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ -a_{n1} & -a_{n2} & \cdots & \sum_{k \neq n} a_{nk} \end{bmatrix}$$

Let  $c_i$  be the cofactor of the *i*-th diagonal element of *L*.

**Theorem** [Kirchhoff (1847)] Assume  $n \ge 2$ . Then

$$c_i = \sum_{\mathcal{T} \in \mathbb{T}_i} w(\mathcal{T}), \qquad i = 1, 2, \dots, n,$$
(4)

where  $\mathbb{T}_i$  is the set of all spanning trees  $\mathcal{T}$  of  $(\mathcal{G}, A)$  rooted at vertex *i*, and  $w(\mathcal{T})$  is the weight of  $\mathcal{T}$ .

# Reordering of a Double Sum

**Proposition** [Tree-Cycle-Identity, Z. Shuai and ML 2009] Let  $c_i$  be given by the Matrix-Tree Theorem. Then the following identity holds.

$$\sum_{i,j=1}^{n} c_i a_{ij} F_{ij}(x_i, x_j) = \sum_{\mathcal{Q} \in \mathbb{Q}} w(\mathcal{Q}) \sum_{(r,s) \in E(\mathcal{C}_{\mathcal{Q}})} F_{rs}(x_r, x_s), \quad (5)$$

where  $F_{ij}(x_i, x_j), 1 \le i, j \le n$ , are arbitrary functions,  $\mathbb{Q}$  is the set of all spanning unicyclic graphs  $\mathcal{Q}$  of  $(\mathcal{G}, A)$ ,  $w(\mathcal{Q})$  is the weight of  $\mathcal{Q}$ , and  $\mathcal{C}_{\mathcal{Q}}$  denotes the oriented cycle of  $\mathcal{Q}$ .

# Reordering of a Double Sum

**Proposition** [Tree-Cycle-Identity, Z. Shuai and ML 2009] Let  $c_i$  be given by the Matrix-Tree Theorem. Then the following identity holds.

$$\sum_{i,j=1}^{n} c_i a_{ij} F_{ij}(x_i, x_j) = \sum_{\mathcal{Q} \in \mathbb{Q}} w(\mathcal{Q}) \sum_{(r,s) \in E(\mathcal{C}_{\mathcal{Q}})} F_{rs}(x_r, x_s), \quad (5)$$

where  $F_{ij}(x_i, x_j), 1 \le i, j \le n$ , are arbitrary functions,  $\mathbb{Q}$  is the set of all spanning unicyclic graphs  $\mathcal{Q}$  of  $(\mathcal{G}, A)$ ,  $w(\mathcal{Q})$  is the weight of  $\mathcal{Q}$ , and  $\mathcal{C}_{\mathcal{Q}}$  denotes the oriented cycle of  $\mathcal{Q}$ .

Proof: Note  $w(\mathcal{T}) a_{ij} = w(\mathcal{Q})$ , where  $\mathcal{Q}$  is the unicyclic graph obtained by adding an arc (j, i) to  $\mathcal{T}$ .

## Proof of Main Theorem

$$\begin{split} & \stackrel{\bullet}{V} = \sum_{i=1}^{n} c_{i} \stackrel{\bullet}{V_{i}} \leq \sum_{i,j=1}^{n} c_{i} a_{ij} F_{ij}(t, u_{i}, u_{j}) \quad (\text{assumption (1)}) \\ & = \sum_{\mathcal{Q} \in \mathbb{Q}} w(\mathcal{Q}) \sum_{(r,s) \in E(\mathcal{C}_{\mathcal{Q}})} F_{rs}(t, u_{r}, u_{s}) \quad (\text{Proposition}) \\ & \leq 0. \end{split}$$

Our Theorem offers a systematic way to construct global Lyapunov functions for the coupled system, using individual Lyapunov functions for the vertex dynamics.

Is the theorem any good?

# Application I: A Network of Coupled Oscillators

$$\ddot{x}_i + \alpha \dot{x}_i + f_i(x_i) + \sum_{j=1}^n \epsilon_{ij} (\dot{x}_i - \dot{x}_j) = 0, \qquad (6)$$

or in systems

$$\dot{x}_i = y_i,$$
  

$$\dot{y}_i = -\alpha_i y_i - f_i(x_i) - \sum_{j=1}^n \epsilon_{ij}(y_i - y_j).$$
(7)

Each vertex dynamics is given by a damped nonlinear oscillator

$$\ddot{x}_i + \alpha \dot{x}_i + f_i(x_i) = 0.$$

Assume that the damping  $\alpha_i \ge 0$  and the potential energy  $F_i(x_i) = \int^{x_i} f_i(s) ds$  has a strictly global minimum at  $x_i = x_i^*$ . Then  $x = x_i^*$  is globally stable (using the Lyapunov function)

$$V_i(x_i, y_i) = F_i(x_i) + \frac{y_i^2}{2}$$

# Application I: A Network of Coupled Oscillators

**Theorem** Assume  $\alpha_k > 0$  for some k and digraph  $\mathcal{G}$  is strongly connected. Then  $E^*(x_1^*, 0, x_2^*, 0, \cdots, x_n^*, 0)$  is globally asymptotically stable in  $\mathbb{R}^{2n}$ .

**Proof.**  $V_i(x_i, y_i) = F_i(x_i) + \frac{y_i^2}{2}$ 

$$egin{aligned} & \hat{Y}_i = -lpha_i y_i^2 - \sum_{j=1}^n \epsilon_{ij} (y_i - y_j) y_i \ & \leq \sum_{j=1}^n \epsilon_{ij} [-rac{1}{2} (y_i - y_j)^2 - rac{1}{2} y_i^2 + rac{1}{2} y_j^2] \ & \leq \sum_{j=1}^n \epsilon_{ij} F_{ij} (y_i, y_j) \end{aligned}$$

where

$$F_{ij}(y_i, y_j) = -\frac{1}{2}y_i^2 + \frac{1}{2}y_j^2.$$

## Application II: A Single Species Model with Dispersal

$$x'_{i} = x_{i}f_{i}(x_{i}) + \sum_{j=1}^{n} d_{ij}(x_{j} - \alpha_{ij}x_{i}), \quad i = 1, 2, \dots, n.$$
(8)

# Application II: A Single Species Model with Dispersal

$$x'_{i} = x_{i}f_{i}(x_{i}) + \sum_{j=1}^{n} d_{ij}(x_{j} - \alpha_{ij}x_{i}), \quad i = 1, 2, \dots, n.$$
(8)

Theorem [Z. Shuai and ML (2009)] Assume

- (1) matrix  $(d_{ij})$  is irreducible;
- (2)  $f'_i(x_i) \leq 0, x_i > 0, i = 1, 2, ..., n; \exists k, f'_k(x_k) \not\equiv 0$  in any open interval of  $\mathbb{R}^+$ ;
- (3) system (8) is uniformly persistent;
- (4) solutions of (8) are uniformly bounded.

Then system (8) has a globally asymptotically stable positive equilibrium  $E^*$ .

# Application II: A Single Species Model with Dispersal

$$x'_{i} = x_{i}f_{i}(x_{i}) + \sum_{j=1}^{n} d_{ij}(x_{j} - \alpha_{ij}x_{i}), \quad i = 1, 2, \dots, n.$$
(8)

Theorem [Z. Shuai and ML (2009)] Assume

- (1) matrix  $(d_{ij})$  is irreducible;
- (2)  $f'_i(x_i) \leq 0, x_i > 0, i = 1, 2, ..., n; \exists k, f'_k(x_k) \not\equiv 0$  in any open interval of  $\mathbb{R}^+$ ;
- (3) system (8) is uniformly persistent;
- (4) solutions of (8) are uniformly bounded.

Then system (8) has a globally asymptotically stable positive equilibrium  $E^*$ .

**Note:** Lu and Tacheuchi (1993) proved the result under the assumption  $f'_i(x_i) < 0$ ,  $x_i > 0$  for all *i*, using the theory of monotone dynamical systems.

$$y'_{i} = y_{i}(-\gamma_{i} - \delta_{i}y_{i} + \epsilon_{i}x_{i}),$$

**Theorem** [Z. Shuai and ML (2009)] Assume that  $(d_{ij})$  is irreducible, and that  $\exists k$  such that  $b_k \delta_k > 0$ . Then the positive equilibrium  $E^*$ , whenever it exists, is unique and globally asymptotically stable in the positive cone  $\mathbb{R}^{2n}_+$ .

Kuang and Tacheuchi (1994) proved the two-patch case.

#### Application III: An *n*-Patch Predator-Prey Model

$$x'_{i} = x_{i}(r_{i} - b_{i}x_{i} - e_{i}y_{i}) + \sum_{j=1}^{n} d_{ij}(x_{j} - \alpha_{ij}x_{i}), \quad i = 1, 2, ..., n.$$
(9)  
$$y'_{i} = y_{i}(-\gamma_{i} - \delta_{i}y_{i} + \epsilon_{i}x_{i}),$$

**Theorem** [Z. Shuai and ML (2009)] Assume that  $(d_{ij})$  is irreducible, and that  $\exists k$  such that  $b_k \delta_k > 0$ . Then the positive equilibrium  $E^*$ , whenever it exists, is unique and globally asymptotically stable in the positive cone  $\mathbb{R}^{2n}_+$ .

Kuang and Tacheuchi (1994) proved the two-patch case.

$$V_i(x_i, y_i) = \epsilon_i(x_i - x_i^* \ln x_i) + e_i(y_i - y_i^* \ln y_i)$$

# Application IV: A Multi-group Delayed Epidemic Model $S'_{i} = \Lambda_{i} - d_{i}^{S}S_{i} - \sum_{j=1}^{n} \beta_{ij}S_{i}I_{j}(t - \tau_{j}),$ $i = 1, 2, \cdots, n. \quad (10)$ $I'_{i} = \sum_{j=1}^{n} \beta_{ij}S_{i}I_{j}(t - \tau_{j}) - (d_{i}^{I} + \gamma_{i})I_{i},$

# Application IV: A Multi-group Delayed Epidemic Model $S'_{i} = \Lambda_{i} - d_{i}^{S}S_{i} - \sum_{j=1}^{n} \beta_{ij}S_{i}I_{j}(t - \tau_{j}),$ $i = 1, 2, \cdots, n. \quad (10)$ $I'_{i} = \sum_{j=1}^{n} \beta_{ij}S_{i}I_{j}(t - \tau_{j}) - (d_{i}^{I} + \gamma_{i})I_{i},$

**Theorem** [Z. Shuai and ML (2009)] Assume that  $B = (\beta_{ij})$  is irreducible. If  $R_0 > 1$ , then the unique endemic equilibrium  $P^*$  for system (10) is globally asymptotically stable in  $\overset{\circ}{\Theta}$ .

# Application IV: A Multi-group Delayed Epidemic Model $S'_{i} = \Lambda_{i} - d_{i}^{S}S_{i} - \sum_{j=1}^{n} \beta_{ij}S_{i}I_{j}(t - \tau_{j}),$ $i = 1, 2, \cdots, n. \quad (10)$ $I'_{i} = \sum_{j=1}^{n} \beta_{ij}S_{i}I_{j}(t - \tau_{j}) - (d'_{i} + \gamma_{i})I_{i},$

**Theorem** [Z. Shuai and ML (2009)] Assume that  $B = (\beta_{ij})$  is irreducible. If  $R_0 > 1$ , then the unique endemic equilibrium  $P^*$  for system (10) is globally asymptotically stable in  $\overset{\circ}{\Theta}$ .

When n = 1, C. McCluskey proved the global stability with Lyapunov function

$$V_{i} = (S_{i} - S_{i}^{*} + S_{i}^{*} \ln \frac{S_{i}}{S_{i}^{*}}) + (I_{i} - I_{i}^{*} - I_{i}^{*} \ln \frac{I_{i}}{I_{i}^{*}}) + \sum_{j=1}^{n} \beta_{ji} S_{i}^{*} \int_{0}^{\tau_{j}} \left( I_{j}(t-r) - I_{j}^{*} - I_{j}^{*} \ln \frac{I_{j}(t-r)}{I_{j}^{*}} \right) dr.$$

A video on Youtube https://www.youtube.com/watch?v=QmWD76jwjbQ GRASP Lab, University of Pennsylvania Each robotic agent has position vector  $r_i = (x_i, y_i) \in \mathbb{R}^2$  and velocity vector  $v_i = \dot{r}_i = (\dot{x}_i, \dot{y}_i)$ .

The system's evolution is governed by Newton's equation

$$\begin{array}{ll} \dot{r}_i = & v_i, \\ \dot{v}_i = & u_i, \end{array} \qquad i = 1, \cdots, n. \eqno(11)$$

#### Here

- $u_i$ ,  $i = 1, \dots, n$ , define the control protocol
- Formation control is achieved through communications among agents
- Network represents the communication graph (topology)
- A complete communication graph is too costly.

# Hierarchical Potential Clustering (HPC) Protocol

Proposed by J. Maidens and ML:

- 1) Divide the agents into clusters
- 2) Assign a leader to each cluster
- 3) Implement an artificial potential scheme (with a complete graph) within each cluster
- 4) Implement a velocity consensus scheme among the cluster leaders.

# HPC Protocol: control within a cluster *i*

For  $j \neq 1$ , (i.e.  $r_{ij}$  is not a leader in cluster *i*)

$$u_{ij} = -\nabla_{r_{ij}} P_{ij} - \sum_{k} \frac{(\theta_{ij} - \theta_{ik})||\mathbf{v}_{ij}||}{||\mathbf{r}_{ij} - \mathbf{r}_{ik}||} \hat{n}(ij),$$

where

$$P_{ij} = \sum_{k=1}^{n_i} P_{ij}^{ik}$$

controls distance of agents in the cluster and

$$heta_{ij} = an^{-1} \Big( rac{\dot{y}_{ij}}{\dot{x}_{ij}} \Big)$$

is the heading of agent (i, j).

#### HPC Protocol: control among leaders

For j = 1, (i.e.,  $r_{i1}$  is the leader in cluster i), we add additional force to control there heading

$$u_{i1} = -\nabla_{r_{i1}} P_{i1} - \sum_{k} \frac{(\theta_{i1} - \theta_{ik})||v_{i1}||}{||r_{i1} - r_{ik}||} \hat{n}(i1) + \sum_{h \in N_i} b_{ih}(v_{h1} - v_{i1})$$

where matrix  $B = (b_{ij})$  is any nonnegative irreducible matrix. The correspond communication graph  $G_B$  among leaders is strongly connected.

# Formation Stabilization Problem

**Definition** A control protocol is said to solve the formation stabilization problem if solutions of (11) converge asymptotically to a state such that

(a) the relative positions of each agent (i, j) within a cluster are such that a local minimum of the total vertex potential  $P_{ij}$  is achieved,

(b) the headings of any two agents (i, j) and (h, k) satisfy  $\theta_{ij} = \theta_{hk}$ .

#### Synchronization

Synchronization of metronomes: a video

https://www.youtube.com/watch?v=Aaxw4zbULMs

## Coupled Oscillators Revisited

Consider a system of coupled oscillators:

$$\ddot{x}_i + f_i(x_i) + \sum_{j=1}^n \epsilon_{ij}(\dot{x}_i - \dot{x}_j) = 0,$$

Assume that  $f_i(x_i)$  and  $F_i(x_i) = \int_i^x f_i(t)dt$  satisfy ( $C_1$ )  $f_i(x_i)x_i > 0$ ,  $x_i \neq 0, i = 1, 2, \cdots, n$ , ( $C_2$ )  $F_i(x_i) \rightarrow \infty$  as  $|x_i| \rightarrow \infty, i = 1, 2, \cdots, n$ .

Both ( $C_1$ ) and ( $C_2$ ) are satisfied for  $f_i(x_i) = x_i^3$ .

# **Global Synchronization**

**Definition**: System (29) is said to achieve global synchronization if, for every solution x(t) of system (29) and all  $1 \le i, j \le n$ ,

$$\dot{x}_i(t)-\dot{x}_j(t)=0.$$

**Question**: Under what conditions of matrix  $A = (a_{ij})$  does the system (29) achieves global synchronization?

# A Theorem

## Theorem (P. Du and ML 2015)

In system (29), suppose that the direct graph  $G_A$  is strongly connected, and assumptions  $(C_1)$  and  $(C_2)$  are satisfied. Then system (29) achieves global synchronization.

For the proof, considering the equivalent system

$$\begin{aligned} \dot{x}_i &= y_i \\ \dot{y}_i &= -f_i(x_i) + \sum_{j=1}^n \epsilon_{ij}(y_j - y_i) \end{aligned}$$

Using Lyapunov functions:

$$V_i=\frac{1}{2}y_i^2+F_i(x_i),$$

and

$$V=\sum_{i=1}^n c_i V_i.$$
